

Vizzi Analytics

Version 1.4.0 Release Notes

Release Date: 8 September 2026

Version 1.4.0 introduces major new workflow automation capabilities, faster ACL integration, expanded import and export options, interface improvements, and deeper AI assistance.

Visual Audit Analytics is now Vizzi Analytics

Visual Audit Analytics has a new name - Vizzi Analytics.

It is the same application, with the same focus on making powerful data analytics easier and more accessible, just with a shorter, simpler name. The new name also better reflects how the application has grown beyond traditional audit analytics to support a much broader range of data analysis and automation.

Same application. Same capabilities. A simpler name: Vizzi.

Workflow & Automation

Loop

The new Loop function makes it easy to repeat a series of tasks for multiple files, records, customers, business units, or other items.

For example, Loop can process every Excel file in a folder, perform the same analysis for each customer, or automatically create separate reports and visualizations for each iteration.

Run Flows Within Flows

Vizzi flows can now call and execute other flows, making it easier to build modular, reusable analytics processes and break complex workflows into manageable components.

Run Windows Batch Files

Execute Windows batch (.bat) files directly from a Vizzi workflow. External commands, scripts, data retrieval processes, and other Windows automation can now become part of a Vizzi flow.

Drop Tasks Directly onto Connectors

Drag a new task onto an existing connector and Vizzi automatically inserts it into the workflow.

Data Import & Export

Drag & Drop File Import

Simply drag supported data files into Vizzi's import wizard to begin importing them, making it faster to get from a source file to analysis.

Export to Parquet

Analysis results can now be exported directly to Parquet, providing a compact, high-performance format for storing and exchanging larger datasets.

Improved Date Recognition

Vizzi now provides better automatic recognition of date fields when importing data, reducing the need to manually correct field types.

Script Mode

Faster ACL Script Execution

ACL scripts can now be launched without opening the full ACL GUI, providing significantly faster execution. Users can select whether scripts run through the traditional ACL interface or directly in ACL Script mode.

Run Selected SQL

Highlight part of a SQL script and run only the selected section. This makes developing, testing, and troubleshooting SQL much faster.

Interface Improvements

Visualization Save & Run Controls

Updated controls provide clearer Save and Run actions when creating and working with visualizations.

Optional Delete Confirmation

Users can now choose to disable the confirmation prompt when deleting tasks, making flow editing faster. Deleted tasks can still be restored using Undo.

AI Assistance

AI-Assisted SQL Error Resolution

When SQL execution fails, ask Vizzi AI to analyze the error, explain what went wrong, and suggest how to fix it.

AI Assistance for Selected SQL

Highlight a section of SQL and ask AI to explain, improve, modify, or troubleshoot just the selected code.

Natural-Language Field Creation

Describe the field you want to create in plain language and let Vizzi AI help generate the required expression or logic.

Performance & Usability Improvements

As with every release, v1.4.0 also includes numerous smaller performance, stability, and usability improvements throughout the application.

Thank You

Thank you for supporting Vizzi Analytics and for the valuable feedback you've provided.

Mike Pretorius
