

Vizzi Analytics

Version 1.4.1 Release Notes

Release Date: 2 October 2026

Vizzi Analytics v1.4.1 introduces new Join capabilities, a new Group Calculation task, improved logging and workflow controls, along with several usability improvements and fixes identified following the v1.4 release.

New Features & Enhancements

Join — Contains Matching

A new **Contains** join option has been added.

Similar to a fuzzy join, **Contains** matching allows records to be joined where the value from one table is contained within a field in the other table.

This is useful when matching data where one source contains additional text or descriptions around the value being matched.

Join — Unmatched Records

Join now includes an **Unmatched** option, making it easier to identify records that do not have a corresponding match in the other table.

This is particularly useful for completeness testing and reconciliation.

Join — First Match Only

A new **First Match Only** option has been added to Join.

When multiple matching records exist, Vizzi can now return only the first matching record rather than creating a result for every match.

This is useful when you need the behaviour of a Full Outer Join but only want a single matching record from the other table.

New Group Calculation Task

A new **Group Calculation** task allows calculations to be performed at a group level and the resulting value added back to each underlying record as a new column.

For example, transactions can be grouped by Journal Entry Number, the total debit amount calculated for each journal entry, and that total added to every transaction belonging to the journal entry.

This eliminates the need to Summarize, Extract and Join the results back to the original dataset.

Export Logs to Excel

Execution logs can now be exported directly to Excel, making it easier to retain, review and share details of analytics runs.

Improved Flow Layout

Automatic flow layout has been improved to provide cleaner and more consistent positioning of tasks. A new auto-layout icon has also been added.

Improved Field & Function Selection

The field and function selector pop-up windows have been improved, making it easier to find and select fields and functions when building expressions.

Loop Improvements

Tasks can now be removed from an existing Loop without having to recreate the Loop.

Undo and Redo functionality has also been updated to work correctly with Loops.

Fixes & Usability Improvements

- **Excel Export** — Fixed instances where numeric values could be exported to Excel as text rather than numbers.
- **Define Field** — Updated the ribbon terminology from *New Field* to *Define Field* for consistency.
- **Define Field** — Moved the *Parse to Date* option into Help to simplify the main interface.
- **AI Formula Assistance** — Improved error handling when AI returns an invalid or unsupported formula.
- **AI Export Assistance** — Improved error handling when AI-generated instructions attempt to export results to Excel.
- **Visualizations** — Removed unnecessary errors when a visualization has no data available to display.

- **Loops** — Fixed Undo and Redo behaviour when working with Loops.
- **Flow Layout** — Improved automatic positioning and layout of flow tasks.
- **Field & Function Selectors** — Improved the selector interface for easier navigation and selection.

Vizzi Analytics v1.4.1 continues to focus on making analytics workflows faster to build, easier to understand and simpler to maintain.

Thank You

Thank you for supporting Vizzi Analytics and for the valuable feedback you've provided.
